1 The undephased and dephased defect of a unitary matrix

The undephased defect of a unitary $N \times N$ matrix U with no zero entries is the value:

$$\mathbf{D}(U) \stackrel{def}{=} \dim_{\mathbb{R}} (\mathbf{T}_U \mathcal{U} \cap \mathbf{T}_U \mathcal{M}_U) , \quad (1)$$

the dimension of the real space being the intersection of the real N^2 dimensional spaces:

- $\mathbf{T}_U \mathcal{U} = \{EU : E \text{ antihermitian}\}$, the space tangent at U to the N^2 dimensional manifold of unitary $N \times N$ matrices: $\mathcal{U} = \{V : V^*V = I\} \ni U$,
- $\mathbf{T}_U \mathcal{M}_U = \{\mathbf{i}R \circ U : R \text{ real}\}$, the space tangent at U to the N^2 dimensional manifold of matrices with the pattern of moduli identical with that of U : $\mathcal{M}_U = \{U \circ \mathbf{EXP}(\mathbf{i}R) : R \text{ real}\} \ni U$ ($\circ$ entrywise product, $\mathbf{EXP}$ entrywise exp).

By the space $\mathbf{T}_U \mathcal{F}$ tangent at U to manifold $\mathcal{F} \ni U$ we understand the real space composed of the derivatives $\gamma'(0)$ of all the differentiable curves $\gamma : (a, b) \rightarrow \mathcal{F}$ such that $0 \in (a, b)$ and $\gamma(0) = U$.

If, for a given unitary U manifold $\mathcal{F}$ satisfies $U \in \mathcal{F}$ and $\mathcal{F} \subset \mathcal{U} \cap \mathcal{M}_U$, then

$$\dim(\mathcal{F}) \leq \mathbf{D}(U) . \quad (2)$$

If, additionally, $\mathcal{F}$ is built from matrices with the k -th row and l -th column fixed, i.e. $V \in \mathcal{F} \implies V_{k,:} = U_{k,:}$ and $V_{:,l} = U_{:,l}$, then

$$\dim(\mathcal{F}) \leq \mathbf{D}(U) - (2N - 1) \stackrel{def}{=} \mathbf{d}(U) , \quad (3)$$

where the value on the right is called the dephased defect of U , and $\mathcal{F}$ is called a dephased manifold in such a situation. Such a manifold doesn't contain, in a neighbourhood of U , matrices equivalent to U , where U and V are equivalent if and only if $V = P_r D_r U D_c P_c$ for some unitary diagonal D_r , D_c and permutation matrices P_r , P_c . This equivalence relation for unitary matrices is an equivalence relation in the usual sense. The defects D and d remain invariant under equivalence operations, that is $\mathbf{D}(P_r D_r U D_c P_c) = \mathbf{D}(U)$.

The undephased and dephased defects can be defined for a rescaled unitary matrix $V = \alpha \cdot U$, where $\alpha \in \mathbb{C} \setminus \{0\}$. Then all the above definitions and comments have to be repeated with some objects multiplied by α : $V = \alpha \cdot U$, $\alpha \mathcal{U} = \alpha \cdot \mathcal{U}$, $\mathbf{T}_V \alpha \mathcal{U} = \alpha \cdot \mathbf{T}_U \mathcal{U}$, $\mathcal{M}_V = \alpha \cdot \mathcal{M}_U$, $\mathbf{T}_V \mathcal{M}_V = \alpha \cdot \mathbf{T}_U \mathcal{M}_U$, $\alpha \mathcal{F} = \alpha \cdot \mathcal{F} \subset \alpha \mathcal{U} \cap \mathcal{M}_V$ for $\mathcal{F} \subset \mathcal{U} \cap \mathcal{M}_U$.

(For more details see section *The defect of a (rescaled) unitary matrix* in *Defect and equivalence of unitary matrices. The Fourier case.* by W. Tadej, available as [arXiv:1310.8119 \[math.RA\]](#).)

2 Fourier matrices and their Kronecker products

The Fourier matrix associated with the cyclic group $\mathbb{Z}_N = \mathbb{Z}/N\mathbb{Z}$ is the symmetric matrix F_N such that $[F_N]_{i,j} = e^{i\frac{2\pi}{N}\tilde{i}\tilde{j}}$, where $i, j \in \mathbb{Z}_N$ and $\tilde{i}, \tilde{j}$ are arbitrary integers representing i, j respectively. $\mathbb{Z}_N$ will be called the indexing group of F_N . The group indices correspond to ordinary indices according to:

$$k \in \{1, 2, 3, \dots, N\} \longleftrightarrow (k-1) + N\mathbb{Z} \in \mathbb{Z}_N. \quad (4)$$

Now we generalize the above concepts. The Fourier matrix associated with the abelian group $I_F = \mathbb{Z}_{N_1} \times \dots \times \mathbb{Z}_{N_r}$ is the symmetric matrix $F = F_{N_1} \otimes \dots \otimes F_{N_r}$, and I_F is its indexing group:

$$F_{(i_1, \dots, i_r), (j_1, \dots, j_r)} = [F_{N_1}]_{i_1, j_1} \cdot \dots \cdot [F_{N_r}]_{i_r, j_r}, \quad (5)$$

where $(i_1, \dots, i_r), (j_1, \dots, j_r) \in I_F$. The group indices correspond to ordinary indices according to the bijection:

$$\begin{aligned} k = \tilde{k}_1 N_2 \dots N_r + \tilde{k}_2 N_3 \dots N_r + \dots + \tilde{k}_{r-1} N_r + \tilde{k}_r + 1 &\in \{1, 2, \dots, N\} \\ \updownarrow & \\ (k_1, k_2, \dots, k_r) = (\tilde{k}_1 + N_1\mathbb{Z}, \tilde{k}_2 + N_2\mathbb{Z}, \dots, \tilde{k}_r + N_r\mathbb{Z}) &\in \mathbb{Z}_{N_1} \times \dots \times \mathbb{Z}_{N_r}, \end{aligned} \quad (6)$$

where $\tilde{k}_x \in \{0, 1, \dots, (N_x - 1)\}$ represents $k_x \in \mathbb{Z}_{N_x}$, and $N = N_1 N_2 \dots N_r$. This bijection is nothing else but lexicographical ordering of I_F . For example in the table below we have collected the group indices (k_1, k_2) belonging to $\mathbb{Z}_2 \times \mathbb{Z}_3$ in the left column, accompanied by the corresponding ordinary indices in the right column.

$(k_1, k_2) \in \mathbb{Z}_2 \times \mathbb{Z}_3$	k
$(0 + 2\mathbb{Z}, 0 + 3\mathbb{Z})$	1
$(0 + 2\mathbb{Z}, 1 + 3\mathbb{Z})$	2
$(0 + 2\mathbb{Z}, 2 + 3\mathbb{Z})$	3
$(1 + 2\mathbb{Z}, 0 + 3\mathbb{Z})$	4
$(1 + 2\mathbb{Z}, 1 + 3\mathbb{Z})$	5
$(1 + 2\mathbb{Z}, 2 + 3\mathbb{Z})$	6

There holds, for $i, j \in I_F$:

$$F_{i,:} \circ F_{j,:} = F_{i+j,:} , \quad (7)$$

i.e. the group of rows of F under the entrywise product $\circ$ is isomorphic to I_F , and every row/column, as a function of I_F , is a homomorphism from I_F to the group of complex roots of unity of order $\mathbf{lcm}(N_1, \dots, N_r)$.

Fourier matrices of the same size, F and G , are equivalent if and only if they are permutation equivalent (i.e. $G = P_r F P_c$ for some permutation matrices P_r, P_c), and this in turn holds if and only if their indexing groups I_F and I_G are isomorphic. Moreover, $F = F_{N_1} \otimes \dots \otimes F_{N_r}$ and $G = F_{M_1} \otimes \dots \otimes F_{M_s}$ are equivalent ($I_F = \mathbb{Z}_{N_1} \times \dots \times \mathbb{Z}_{N_r}$ and $I_G = \mathbb{Z}_{M_1} \times \dots \times \mathbb{Z}_{M_s}$ are isomorphic) if and only if we can transform one into the other using the operations:

a) reordering

b) gluing objects $F_A \otimes F_B \longrightarrow F_{AB}$ ($\mathbb{Z}_A \times \mathbb{Z}_B \longrightarrow \mathbb{Z}_{AB}$) if $\gcd(A, B) = 1$

c) splitting objects $F_{AB} \longrightarrow F_A \otimes F_B$ ($\mathbb{Z}_{AB} \longrightarrow \mathbb{Z}_A \times \mathbb{Z}_B$) if $\gcd(A, B) = 1$

Using operations **a)** and **c)** any F (I_F) can be transformed into an equivalent matrix G (an isomorphic group I_G) whose every factor has the size (the order) being a power of a prime. G (I_G) can be further reordered in such a way that these primes form a non-decreasing sequence, while the exponents in each group of identical primes form a non-increasing sequence. A subproduct of such G (I_G) containing all the factors with a given prime will be called a maximal primary subproduct. Let a be a prime and $F_{a^{k_1}} \otimes \dots \otimes F_{a^{k_s}}$ ($\mathbb{Z}_{a^{k_1}} \times \dots \times \mathbb{Z}_{a^{k_s}}$) be a maximal primary subproduct of G (I_G), then we will represent this subproduct by $a^{[k_1 \ k_2 \ \dots \ k_s]}$, where, as we have said above, $k_1 \geq k_2 \geq \dots \geq k_s$. If G has maximal primary subproducts associated with primes $a < b < c < \dots$ then we will represent it by $a^{[k_1 \ k_2 \ \dots \ k_s]} b^{[l_1 \ l_2 \ \dots \ l_t]} c^{[m_1 \ m_2 \ \dots \ m_u]} \dots$. F' and F'' are equivalent ($I_{F'}$ and $I_{F''}$ are isomorphic) if and only if the corresponding G' and G'' ($I_{G'}$ and $I_{G''}$) of the form described above are identical, because two different G', G'' ($I_{G'}, I_{G''}$) of this form are not equivalent (isomorphic).

Example:

$$\begin{aligned} F &= F_6 \otimes F_{20} \otimes F_{18} \longrightarrow F_2 \otimes F_3 \otimes F_4 \otimes F_5 \otimes F_2 \otimes F_9 \\ &\longrightarrow (F_4 \otimes F_2 \otimes F_2) \otimes (F_9 \otimes F_3) \otimes F_5 = G , \end{aligned} \quad (8)$$

where G corresponding (and equivalent) to F has three maximal primary subproducts associated with primes $2 < 3 < 5$. G is represented by $2^{[2\ 1\ 1]}3^{[2\ 1]}5^{[1]}$.

(For more details see section *Fourier matrices, symmetries and equivalence* in *Defect and equivalence of unitary matrices. The Fourier case.* by W. Tadej, available as [arXiv:1310.8119 \[math.RA\]](#) .)

3 The undephased and dephased defects of Fourier matrices of size up to $N = 10000$

Fourier matrices are rescaled unitary matrices, therefore for any $F = F_{N_1} \otimes \dots \otimes F_{N_r}$ we can calculate the undephased and dephased defects, $\mathbf{D}(F)$ and $\mathbf{d}(F)$. Since every F is equivalent to a unique G of the form described at the end of the previous section, it suffices to provide the defects of all possible G 's of size N to cover all F 's of size N . The table below lists the defects of all G 's with the size ranging from 1 to 10000. The G 's are represented as it was described above. In the table N denotes the size of matrices in the rows that follow.

(For more details see section *The defect of a Fourier matrix* in *Defect and equivalence of unitary matrices. The Fourier case.* by W. Tadej, available as [arXiv:1310.8119 \[math.RA\]](#) .)
